For this project, I used Canva AI to generate an image of “me” based on a prompt I fed the processor. I directed it to make a “21 year old girl with brown eyes and brown hair,” which are vague descriptors that apply to me. I also told Canva AI to make her smile and be in a university setting. I got this image as a result.

While all of these physical descriptors apply to me (i.e. brown hair and eyes, smiling, at college), this “person” does not look much like me. I feel as though she has some common traits with me, but the execution is quite different, and I feel like it can be told that she is AI-generated. Her face is slightly blurry and her eyes don’t really have pupils. These are a few of many distinctions that makes her obviously AI-generated.

For the remix portion of the project, I decided to manipulate the setting and dress of the girl. I told Canva AI to make her wear a pretty dress and put her in a beautiful location. I got a photo of her wearing a short, black dress, which is not initially what I had in mind for her outfit, because I assumed it would have picked something of a lighter color or with more detail to it. For reference, this is the image I got:

Unfortunately, the image has quite low resolution, with Canva AI trying to get me to pay for the subscription to “boost resolution” (as can be seen in the lower left hand corner). I feel like this choice of dress is really interesting, because I would not typically choose to wear a black dress in a sunny setting like this, and I think most girls would agree with this. This shows the limits of the AI, and I was somewhat surprised that it wouldn’t pull a more light, floral sundress from other images on the internet. I thought the trees were really pretty and I also think that it’s cool that her smile looks slightly different, which seems like she could be real, even though there are some giveaways that she is not, as mentioned earlier. By manipulating the setting and outfit of this character, I was able to change the perception of her from a college student to someone attending a fancy event in a dress.

Overall, this was a really interesting project as someone who does not use AI very often.

AI Attribution Box:

I used Canva AI to complete this project. The first prompt I used was to “make a smiling 21 year old girl with brown eyes and hair” and I also prompted it to put her in a university setting following that prompt. Then, I intervened, and said to “put her in a pretty dress in a beautiful location”. I edited this to have her smiling as well. This shows that AI requires some human editing.
