

1. The Speculative Artifact

- Document, image, or object documentation
- High quality execution
- Future date clearly marked

2. Context Statement (300 words)

- What future does this depict? (Year, key events)
- What present trends led here?
- What assumptions about human-AI relations does it reveal?

This artifact, in my opinion, reflects a dystopian future of AI takeover. In this eviction letter from the future, it can be seen that AI and the programmed HouseBot® rule the housing market in the future, which takes the humanity out of it. It connects to present trends of homelessness and struggle in the workforce, as the ideas about AI's role in society are discussed. It assumes that in the future, AI is in control of humans in society, which is a future that we should avoid. In this future, the AI is in charge of the human's ability to live in this place, as it owns the building and monitors it. In the current world, people who run homes and lease to people are able to control this in a more human way by giving people extensions and having humanity to understand people's circumstances. In the AI-dominated world, however, it is possible that this AI HouseBot® does not have room in its algorithm to be understanding or make exceptions, which is a problem. This will end up being harmful to the consumer, or more specifically, the people trying to make it week to week on a certain paycheck. Additionally, if the AI is taking human jobs, the people may be more likely to receive these eviction notices if they are unable to pay for their housing because a robot took their job. This is extremely problematic because with the way society is set up, people need to be able to make money to pay for their housing. If AI both runs the housing and the job market, it boxes people out, making this a dystopian society to live in.

3. Critical Reflection (250 words)

- Is this future desirable? Avoidable? Inevitable?
- What does this future reveal about the present?

- What would need to change to get to (or avoid) this future?

I think this future is something we need to avoid as much as physically possible. While AI is a helpful supplementary tool at the moment, it can quickly take over if we are not careful. This future is not desirable, as it boxes humans into not being able to afford their rent and being evicted by a cold machine that has no room for empathy in its robotic algorithm. This would be a huge problem and a big shift from the way the world is now, making it a dystopian fantasy. People need to remember where AI belongs, and how it doesn't deserve to rule over us, but should rather be a technological tool that we use as a help to us. I do not think this future is inevitable, but if we are not careful, it could happen. I think there is a way to control our use of AI in an easy way, but people need to be united under the idea of doing so. If we all commit as a society to doing better on this front, this is a completely avoidable future. If people continue to let AI take over where it should not, however, there is another discussion at hand. Regardless, I hope that this will not be the case. We need to make sure that AI doesn't take away our rights to our homes and jobs while still using it as a helpful tool.

4. Attribution

- Any AI tools used in creation
- Image sources
- Design templates

No AI was used in this, as I drew it by hand on a piece of paper.
