Comic Project

At first, I thought the AI generated image was very efficient, as it generated nearly instantly and required no artistic ability on my part. But once I looked closer at the image, there were discontinuities that affected the quality of the artwork that I had to edit substantially. I decided to make my comic about a girl and her pet dog getting a snack. I used ChatGPT to generate the image, and then I wrote the words myself. I had not used ChatGPT to make images before. My first prompt was for a 4-panel comic, and I said to make a comic of a girl and her dog getting a snack, but one of the images I got was not something I thought fit well in the story, so I decided to tell the AI to change that panel out for a different one. It was able to do so. Now that the requirement is to make a 6-panel comic, I went back to the same page and asked it to add two more panels to the original comic. This is where things got tricky. For some reason, it was quite challenging to add more panels to the comic, and the AI seemed to not really understand what I was asking. When I asked it to revise some of the panels on the 6-panel comic, it would give me a new 4-panel comic. I wonder if this is the default. Either way, I finally was able to get these images, which I added my own writing to:

I told ChatGPT to include empty speech spaces so that I could fill in the text myself. It was also quite linear of a story in some ways, but also not. For example, she greets her dog and gets the food, which makes sense, but then it goes to her being alone for the next two panels, which I found weird. I was curious as to why this was. I found this project really interesting because I have not done this and didn't realize how quickly these images could be made.
