GIF:

Respond to **all** of the following:

- What changes when an image **repeats** instead of standing still?
- How does looping affect attention, meaning, or emotion?
- Where do you see **human choice** in your GIF?
- Where do you see **automation or pattern**?
- How does AI complicate ideas of authorship or originality?

When an image repeats instead of standing still, it helps emphasize a point that is trying to be made by the GIF. By viewing the GIF several times, it helps cement an idea into the viewer that may not have been done in the same way if it was not a video. This can function in several ways. It can also help you see the parts of the video you missed the first time by rewatching it, or if it is a quote, it also allows for you to rewatch the video and quote along with it, which is something that can be fun and engaging for the viewer.

The looping of the video connects to this idea by altering the attention span, meaning of the image, and emotions associated with the image. GIFs can sometimes be looked at for longer than solely a few seconds because it loops, which means that people are spending more attention on the GIF than they would if it was not looping. This gives the

GIF a different meaning than it would have if it wasn't looping. This can cause different kinds of emotions, but especially because of the looping it can cause a positive effect onto the visual.

Human choice is evident in the subject of the GIF, as well as the text, but not much other than that. I had ChatGPT generate images for the GIF, and then I downloaded those as a .zip file from an image splitter, then I uploaded the split image files onto ezgif.com, which then made it into a GIF. I then wrote the text "high five!" which is something that humans say. I can't take credit for the artwork behind the GIF itself because it was not made by me, but I guess I can be part of organizing the GIF into the final product.

I see automation and pattern both in the repetitions, as well as the way the GIF is constructed. Because it repeats, it is easily seen as automated.

AI definitely complicates the ideas of originality and artwork. As I said in my discussion post, I think humans cannot take credit for AI-generated art, because it was made by a computer and not them. If this was not an AI-specific assignment, I would consider it cheating to call this work my own for any other instance because I did no artwork, all I did was prompt the generator to give a certain image. Although this is the case, I did give it the direction to come together into this final product.

At the bottom of your page, include a short transparency section:

- **Tools used:**
- **AI prompts (if any):**
- **What the AI generated:**
- **What you changed, edited, or remixed:**
- **Sources of any reused material (if applicable):**

This section is part of the assignment.

Tools used: ChatGPT, [Pinetools.com](https://pinetools.com), [Ezgif.com](https://ezgif.com)

AI Prompts:

ChatGPT: "give me a series of 20 images of two friends high-fiving, and make each one sequential like a flipbook"

Pinetools: split this 20 image collage into 20 separate images.

Ezgif: make it into a GIF and add text

I used ChatGPT to design photos for me to use, which came out as a collage. I then took this collage to pinetools.com to split it into 20 separate files that I could use to be a series to make the GIF. This I did on [Ezgif.com](https://ezgif.com), which was also used to add the text.
