Design Statement:

For this assignment, we chose to make our Twine game about an AI interviewer, which was the first option listed. This story explores the relationships between humans and AI, specifically focusing on making the person playing the game have to choose whether to go along with the AI interview or whether to be hesitant about it. The choices of the player matter in this way, because they are ultimately choosing to either align with the AI's decisions or whether to fight back against the screen and assert their own vision. This also is the agency that the player has to control the fate of the game, because the rest of it is written by the author of the game; the agency of choosing what not to allow in your game is one of the most important decisions in this context, as it is a reflection and affirmation of one's preferences. The rules and mechanics support the theme because it is about AI and human interactions, and this game is an interaction between a human and a website, which can be seen as similar conceptual dynamics in terms of the two's nature and abilities. Additionally, the ideas of the AI knowing things it shouldn't come up in the game, because the person would tell it something and it would say "that doesn't match what is in my database." This brings up the larger issue of what AI should know, which can be debated across topics as well. This tension highlights how AI systems can subtly pressure users into conformity by depicting their responses as more correct and authoritative, especially users who are not familiar within a certain topic. In this context, the player's agency lies in their assertion of human subjectivity and lived experience against a system made to average and standardized human experience.

3. "How I Use AI" Page (on your website)

I used ChatGPT for initial brainstorming purposes but then wrote the story by hand in each prompt. We used AI to create an outline/framework for our game goals/narratives but for nothing further.

4. Artist Statement

I used very little AI involvement to make my game, because I have more fun writing than letting AI write for me. I enjoyed this process more because of that and I think it allowed me to engage into the make more. I think I learned a lot about the way that games are made by understanding how each piece connects to the next and the interconnectedness of different components of the game, which was really interesting to see when looking at its final product and stage. In the future, I would make another game about another topic that was less creepy and more positive, because the story took a little bit of a turn to be creepy and a little too invasive with the technology bringing up more personal questions of surveillance and knowledge. In the

future, more AI could have been useful in writing the story and guiding its narrative, but I really enjoyed writing it by hand. This observation also reinforces the player's sense of agency within the game, as each response to the AI interviewer becomes a deliberate choice about how much control to give up or retain. By deciding whether or not to agree with AI or question its outputs, the player actively shapes the interaction, reflecting on their own comfort with being perceived and evaluated by a nonhuman system. The tension between acceptance and resistance highlights the main theme in the human versus AI decision making processes, while also reinforcing how small decisions we make can shape the direction and meaning of the overall experience we have with games and other online platforms with strategies such as rejecting and subverting certain assertions made by AI.
